

Phase 3 – Project Design

AI WeatherWise Project – Architecture & ER diagrams included

1. Architecture Design

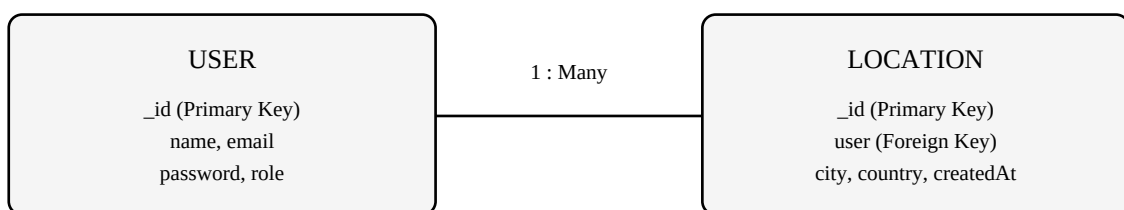

The source document describes an MVC-based backend. Controllers coordinate weather fetching and Gemini insight generation; Models manage User and Location entities. In the headless backend, the API routing layer acts as the interface layer.

2. User Flow

Register/Login → Save favorite city → Fetch current weather → Request AI insight → JWT validation → Response.

3. ER / Data Design

4. Other Design Items

- API routes using GET, POST, PUT and DELETE.
- JWT authentication and role-based route guarding.
- Payload sanitization.
- Postman/Thunder Client API request-response design.
